

# DLC

## Diamond like carbon

(Coefficient of friction)

- ※ DLC is the evaluation result by the base silicon wafer material.
- ※ Other surface treatments are evaluated using SUS304 (surface roughness Ra0.02mm)
- ※ DLC SUS evaluation results are based on separate document.

It is possible to apply DLC processing to the bar coater.

In addition to high hardness, DLC treatment has a low coefficient of friction, which improves wear resistance and can be expected to reduce coating scratches. In addition, since it is more hydrophilic than SUS or hard chrome plating, it can be expected to improve the smoothness of the liquid.
